-----

A new study reveals that the sound of wind turbines does not affect attention or the brain, but beliefs do.

Wind variability, turbine wake effects, and extreme events are not just challenges but opportunities to deepen our understanding of the atmosphere and enhance the resilience of wind ...

Wind turbines can be over 200 feet tall with blades not far behind in size as well. Their presence not only slows wind passing through an area, but also creates kinetic movement of air as ...

Noise levels at a 350m distance from a typical wind farm is 35-45 dB--comparable to a quiet bedroom (35 dB) and quieter than a car traveling 40 mph at 100m distance (55 dB). 29 Multiple studies ...

NREL's 305-acre Flatirons Campus, which houses the National Wind Technology Center, is an ideal setting for evaluating the reliability and performance of wind turbines because it experiences diverse ...

While there have been instances of wind turbines mounted on rooftops, it should be noted that all wind turbines vibrate and transmit the vibration to the structure on which they are mounted. This can lead ...

Wind power plays a pivotal role in this debate. Wind power is a "form of energy conversion in which turbines convert the kinetic energy of wind into mechanical or electrical energy ...

Wind turbines affect the weather in several ways. Perhaps most obviously, given they generate power by extracting kinetic energy from the air, turbines slow down the wind behind them.

Wind Energy Wind power or wind energy is a form of renewable energy that harnesses the power of the wind to generate electricity. It involves using wind turbines to convert the turning ...

A wind turbine simply converts the kinetic energy of the wind into mechanical energy, and that is converted into electrical energy. We can feel the energy of the wind on our hand.
