What is a self-consistent microgrid?

Designs a "self-consistent microgrid" to meet the energy needs of highway transportation infrastructure. Generates energy from transportation infrastructure for fully self-consistent clean energy use in highways. Explores coupling between self-consistent energy system and highway system, formulates a multi-mode control strategy.

What are microgrid solutions?

Solutions are formulated that contain the electricity-hydrogen coupling characteristics and energy scheduling scheme within the microgrid, the multi-microgrid interconnection and mutual aid scheme between microgrids, and the carbon trading method between the highway transportation system and the energy system.

Are microgrids a potential for a modernized electric infrastructure?

Electricity distribution networks globally are undergoing a transformation, driven by the emergence of new distributed energy resources (DERs), including microgrids (MGs). The MG is a promising potential for a modernized electric infrastructure,.

How a microgrid is interconnected and mutual benefit of electricity?

The method involves the interconnection and mutual benefit of electricity for multiple microgrids and carbon trading between highway transportation system and energy system under the coupled electricity-hydrogen operation mode in each sub-microgrid. The results of the case study show that:

In summary, the current research on carbon trading for microgrid systems mainly focuses on direct carbon trading between microgrids, whereas the highway transportation energy system ...
