-----  
What is the inlet air temperature?

The inlet air temperature varies from 15°C to 20°C, 25°C, 30°C and the working current are arranged from 0 to 30 A. The surface temperature of heat source and coefficient of system performance are respectively simulated and studied to show the impact of the inlet air temperature on these dependent variables.

What temperature should a generator be rated at?

o pull a rated full load between 40°C (104°F) and 50°C (122°F). The cooling systems are designed to operate in these ambients, and when enclosed, the canopy design has to allow the correct amount of air in and out. While a generator's rated power output will be reduced as the ambient air temperature increases above 21°C (70°F), the

Should a generator air inlet be facing the wind?

When ever possible, face the generator air inlet openings away from the wind. The wind can prevent the air intake louver from opening on start up. The air inlet must be capable of moving enough air through the room to provide the correct minimum CFM (cubic feet per minute) cooling for generator as specified by the generator's manufacturer.

Does a generator need ventilation?

When a generator is installed and operated in an indoor environment, adequate ventilation for heat dissipation and combustion is required. Ventilation is typically done through the use of an air inlet, air outlet/exhaust fan, and/or other ventilation openings. When ever possible, face the generator air inlet openings away from the wind.

The ambient temperature measured should be that of the cooling medium. In the case of an air cooled machine such as an AvK or STAMFORD alternator, this would be the air inlet air temperature. This ...
