What is electrically conductive glass?

Increasingly, electrically conductive glass is used in photovoltaic modules as the front contact of the solar cell, to form a system which generates a direct electrical current. The United States and the European Union in particular, are encouraging the production of renewable energy.

Can glass be used as a mirror for concentrated solar power?

We then turn to glass and coated glass applications for thin-film photovoltaics, specifically transparent conductive coatings and the advantages of highly resistive transparent layers. Finally, we discuss the use of coated glasses as mirrors for concentrated solar power applications.

What are the advantages of glass in solar panels?

Glass is an integral and important element of photovoltaic solar panels. To increase efficiency, low-iron glass, which is more expensive, but clearer than ordinary glass, is increasingly specified. Anti-reflective coatings can also increase the amount of usable solar energy.

Can glass improve solar energy transmission?

We begin with a discussion of glass requirements, specifically composition, that enable increased solar energy transmission, which is critical for solar applications. Next we discuss anti-reflective surface treatments of glass for further enhancement of solar energy transmission, primarily for crystalline silicon photovoltaics.
