Ut and Ur are located in the transmit and reflect spaces of IOS. The recovered power ... This article derives the throughput of simultaneously transmitting and reflecting reconfigurable intelligent ...

Depending on application scenarios, WIPT can be further divided into two fundamental models, namely simultaneous wireless information and power transfer (SWIPT) and wireless powered communication ...

By enabling dynamic adjustment of signal reflections, RIS can enhance communication coverage, improve throughput, and increase energy efficiency--all while maintaining cost ...

Discover how a grid-connected photovoltaic inverter and battery system enhances telecom cabinet efficiency, reduces costs, and supports eco-friendly operations.

W. Mei and R. Zhang, "Intelligent reflecting surface for multi-path beam routing with active/passive beam splitting and combining," to appear in IEEE Communications Letters.

In this paper, we provide a comprehensive literature overview on IRS technology, including its basic concepts and reconfiguration, as well as its design aspects and applications for ...

Intelligent reflecting surface (IRS) is a potential candidate for massive multiple-input multiple-output (MIMO) 2.0 technology due to its low cost, ease of deployment, energy efficiency and ...

This paper investigates an intelligent reflecting surface (IRS) aided green multiple-user downlink communication system.

Intelligent reflecting surfaces (IRS) are a new technology that improves communication range, bit rate, and

Solar-powered communication cabinet inverter and online intelligent reflective surface

energy efficiency with relatively modest deployment costs. IRS is a sizable 2D metamaterial ...

Reconfigurable intelligent surface (RIS) is a surface that comprises electrically steerable elements. It has a capability of manipulating incident waves in various ways such as reflection, refraction, ...
