Contrary to the widespread belief that LFP (Lithium Iron Phosphate) batteries last longer, the data shows NCA or NCM batteries have lower degradation rates compared to LFP batteries. Of ...

LFP Teslas are newer, so there's not a whole lot of info about real-world battery degradation for them. For NCM Teslas, it's normal for them to lose roughly 5% in the first year, then ...

Tesla's LFP batteries facing an unexpected challenge! Dive into the mystery of degradation--what's causing the dip in performance? The answers await.

For the entry-level rear-wheel-drive Tesla Model 3 with the lithium iron phosphate (LFP) battery, one of the best ways to minimize battery degradation, according to Tesla, is to fully...

Some of the biggest advantages of lithium iron phosphate (LFP) batteries, compared to nickel manganese cobalt (NMC) cells, are lower production costs and minimal degradation over time, ...

So to summarize the article: if you want your LFO battery to live as long as possible, keep it in between 70% and 20%. Only charge it to 100% if the battery management system cannot accurately measure ...

Now that LFP batteries have been operating for a couple months in the US, I thought it would be useful to start a thread for people to post their experiences with degradation of LFP batteries.

For years, automakers like Tesla have encouraged drivers to regularly charge their LFP-equipped vehicles to 100% without fear of significant battery degradation.

The myth that LFP batteries like the one in the RWD Tesla Model 3 can be charged to 100% at all times without worries has been shattered by a new study.

A battery health test on a Tesla Model 3 with only 10,000 miles on the odometer showed that LFP cells can

Tesla lfp battery degradation

have high degradation despite high-durability claims
