A method for automatically identifying global solar photovoltaic (PV) panels based on a cloud platform by using remote sensing. Optical images in a study area for a whole specific year are collected based ...

To address these limitations, we provide a VHR satellite imagery dataset of annotated, primarily residential, solar panels to supplement the ever-growing list of solar panel datasets.

To address this, this paper proposes a spatial-spectral differential semantic fusion network named FusionPV to comprehensively map PV locations within complex geographical environments.

To reduce the misclassification of targets or backgrounds, a Photovoltaic Index (PVI) is constructed based on the optical characteristics of PV panels and serves as prior knowledge to ...

Solar panel segmentation (SPS) is identifying and locating solar panels from remote sensing images, such as aerial or satellite imagery. SPS is critical for energy monitoring, urban ...

In this article, we propose a deep learning extraction method for photovoltaic panels that effectively improves the spatial and spectral differences inherent in remote sensing images.

By calculating and optimizing five common spectral indices based on the physical characteristics of PV modules and corresponding spectral features, solar panels were detected in ...

Solar panel segmentation refers to the process of identifying and delineating individual solar panels within an image or aerial view. This segmentation task is essential for various ...

Remote sensing (RS), a versatile technology that captures surface information at various temporal and spatial scales, is now widely applied in different fields of the PV development.
